CHRONIC DISTAL BICEPS REPAIR WITH OR WITHOUT ALLOGRAFT REHABILIATION PROTOCOL

	RANGE OF MOTION	IMMOBILIZER	EXERCISES
PHASE I 0-2 Weeks	None	Sling and postop posterior splint or hinged elbow brace locked at 90 degrees	Gentle wrist and shoulder ROM, grip strength *Okay to use phone, desk work, etc but no lifting
		Worn at all times (brace can be removed for hygiene and exercises)	*Lower body, core, and cardio (no running) okay if arm in brace/splint and arm not being used
PHASE II 2-6 Weeks	PROM as tolerated, limiting extension to 30 degrees; passive flexion as tolerated – no active flexion or supination	Brace locked at 90 degrees until 4 weeks, then unlocked 30-90 until 6 weeks Worn at all times, removed for hygiene and exercises	Begin gentle active-assisted/active extension to 30 degrees; continue wrist/shoulder ROM, gentle joint mobs okay No active supination or flexion
PHASE III 6-9 weeks	Gradual return to full active extension, continued passive flexion	Discontinue brace at 6 weeks	Begin gentle active flexion without resistance
PHASE IV 9-12 weeks	Full and pain-free AROM	None	Begin isometrics and light resistance with gradual progression as tolerated with slow, steady movements
PHASE V 12-16 weeks	Full and pain-free	None	Advance strengthening as tolerated No plyometrics or cross-fit movements that involve biceps (elbow flexion)
PHASE VI 16+ weeks	Full and pain-free	None	Continue to advance weight/resistance gradually as tolerated, gradually resume to all activities

**Patient protocols may vary. Please follow patient-specific script if modified
